# **Interpretable Machine Learning**

# **Correlation and Dependencies**

#### Learning goals

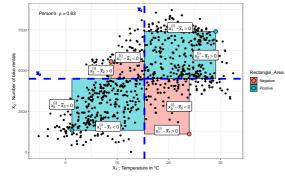

- Pearson correlation
- Coefficient of determination R<sup>2</sup>
- Mutual Information
- Correlation vs. dependence

## PEARSON'S CORRELATION COEFFICIENT $\rho$

**Correlation** often refers to Pearson's correlation (measures only **linear relationship**)

$$\rho(X_1, X_2) = \frac{\sum_{i=1}^{n} (x_1^{(i)} - \bar{x}_1) \cdot (x_2^{(i)} - \bar{x}_2)}{\sqrt{\sum_{i=1}^{n} (x_1^{(i)} - \bar{x}_1)^2 \sum_{i=1}^{n} (x_2^{(i)} - \bar{x}_2)^2}} \in [-1, 1]$$

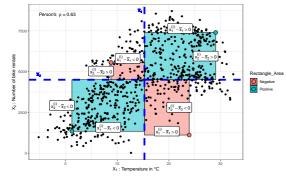

- Numerator is sum of rectangle's area with width  $x_1^{(i)} \bar{x}_1$  and height  $x_2^{(i)} \bar{x}_2$
- Areas enter numerator with positive (+) or negative (-) sign, depending on position
- Denominator scales the sum into the range [-1, 1]

## PEARSON'S CORRELATION COEFFICIENT $\rho$

**Correlation** often refers to Pearson's correlation (measures only **linear relationship**)

$$\rho(X_1, X_2) = \frac{\sum_{i=1}^{n} (x_1^{(i)} - \bar{x}_1) \cdot (x_2^{(i)} - \bar{x}_2)}{\sqrt{\sum_{i=1}^{n} (x_1^{(i)} - \bar{x}_1)^2 \sum_{i=1}^{n} (x_2^{(i)} - \bar{x}_2)^2}} \in [-1, 1]$$

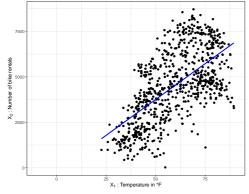

- Numerator is sum of rectangle's area with width  $x_1^{(i)} \bar{x}_1$  and height  $x_2^{(i)} \bar{x}_2$
- Areas enter numerator with positive (+) or negative (-) sign, depending on position
- Denominator scales the sum into the range [-1, 1]
- ullet ho > 0 if positive areas dominate negative areas  $\leadsto X_1, X_2$  positive correlated
- ullet  $\rho < 0$  if negative areas dominate positive areas  $\leadsto X_1, X_2$  negative correlated
- $\rho = 0$  if area of rectangles cancels out  $\rightsquigarrow X_1, X_2$  linearly uncorrelated

## COEFFICIENT OF DETERMINATION R<sup>2</sup>

Another method to evaluate **linear dependency** between features is  $R^2$ 

$$\hat{x}_2 = \hat{f}_{LM}(x_1) = \theta_0 + \theta_1 x_1$$

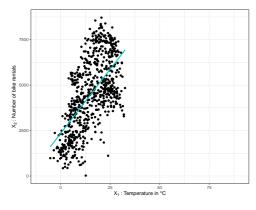

$$\rightsquigarrow$$
 Slope  $\theta_1 = 0 \Rightarrow$  no dependence

 $\rightsquigarrow \ \, \text{Large slope} \Rightarrow \text{strong dependence}$ 

## COEFFICIENT OF DETERMINATION R<sup>2</sup>

Another method to evaluate **linear dependency** between features is  $R^2$ 

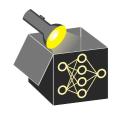

$$\hat{x}_2 = \hat{f}_{LM}(x_1) = \theta_0 + \theta_1 x_1$$

$$\rightsquigarrow$$
 Slope  $\theta_1 = 0 \Rightarrow$  no dependence

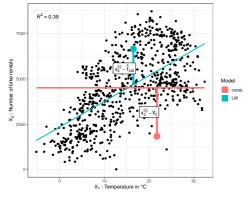

- $\rightsquigarrow \ \, \text{Large slope} \Rightarrow \text{strong dependence}$
- Exact  $\theta_1$  score problematic
- $\rightsquigarrow$  Re-scaling of  $x_1$  or  $x_2$  changes  $\theta_1$

$$ightsquigarrow$$
 °F  $ightarrow$  °C  $\Rightarrow$   $\theta_1 = 78 
ightarrow$   $\theta_1^* = 141$ 

## COEFFICIENT OF DETERMINATION R<sup>2</sup>

Another method to evaluate **linear dependency** between features is  $R^2$ 

- Fit a linear model:  $\hat{x}_2 = \hat{f}_{LM}(x_1) = \theta_0 + \theta_1 x_1$
- $\rightsquigarrow$  Slope  $\theta_1 = 0 \Rightarrow$  no dependence
- $\rightsquigarrow$  Large slope  $\Rightarrow$  strong dependence
- Exact  $\theta_1$  score problematic
- $\rightsquigarrow$  Re-scaling of  $x_1$  or  $x_2$  changes  $\theta_1$ 
  - Set  $SSE_{LM}$  in relation to SSE of a constant model  $\hat{f}_c = \bar{x}_2$  $SSE_{LM} = \sum_{i=1}^n (x_2^{(i)} - \hat{f}_{LM}(x_1^{(i)}))^2$   $SSE_c = \sum_{i=1}^n (x_2^{(i)} - \bar{x}_2)^2$

 $\Rightarrow$  Measure of fitting quality of LM:  $R^2 = 1 - \frac{SSE_{LM}}{SSE_c} \in [0, 1]$ 

$$\Rightarrow \rho(X_1, X_2) = R$$

## JOINT, MARGINAL AND CONDITIONAL DISTRIBUTION

For two discrete random variables  $X_1, X_2$ :

#### Joint distribution

$$p_{X_1,X_2}(x_1,x_2) = \mathbb{P}(X_1 = x_1,X_2 = x_2)$$

$p_{X_1,X_2}$	$\mathbb{P}(X_2=0)$	$\mathbb{P}(X_2=1)$	$p_{X_1}$
$\mathbb{P}(X_1=0)$	0.2	0.3	0.5
$\mathbb{P}(X_1=1)$	0.1	0.4	0.5
$p_{X_2}$	0.3	0.7	1

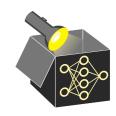

## JOINT, MARGINAL AND CONDITIONAL DISTRIBUTION

For two discrete random variables  $X_1, X_2$ :

#### Joint distribution

$$p_{X_1,X_2}(x_1,x_2) = \mathbb{P}(X_1 = x_1,X_2 = x_2)$$

$p_{X_1,X_2}$	$\mathbb{P}(X_2=0)$	$\mathbb{P}(X_2=1)$	$p_{X_1}$
$\mathbb{P}(X_1=0)$	0.2	0.3	0.5
$\mathbb{P}(X_1=1)$	0.1	0.4	0.5
$p_{X_2}$	0.3	0.7	1

### **Marginal distribution**

$$p_{X_1}(x_1) = \mathbb{P}(X_1 = x_1) = \sum_{x_2 \in \mathcal{X}_2} p(x_1, x_2)$$

$p_{X_1,X_2}$	$\mathbb{P}(X_2=0)$	$\mathbb{P}(X_2=1)$	$p_{X_1}$
$\mathbb{P}(X_1=0)$	0.2	0.3	0.5
$\mathbb{P}(X_1=1)$	0.1	0.4	0.5
$p_{X_2}$	0.3	0.7	1

→ In continuous case with integrals

## JOINT, MARGINAL AND CONDITIONAL DISTRIBUTION

For two discrete random variables  $X_1, X_2$ :

#### Joint distribution

$$p_{X_1,X_2}(x_1,x_2) = \mathbb{P}(X_1 = x_1,X_2 = x_2)$$

$p_{X_1,X_2}$	$\mathbb{P}(X_2=0)$	$\mathbb{P}(X_2=1)$	$p_{X_1}$
$\mathbb{P}(X_1=0)$	0.2	0.3	0.5
$\mathbb{P}(X_1=1)$	0.1	0.4	0.5
$p_{X_2}$	0.3	0.7	1

#### **Marginal distribution**

$$p_{X_1}(x_1) = \mathbb{P}(X_1 = x_1) = \sum_{x_2 \in \mathcal{X}_2} p(x_1, x_2)$$

$p_{X_1,X_2}$	$\mathbb{P}(X_2=0)$	$\mathbb{P}(X_2=1)$	$p_{X_1}$
$\mathbb{P}(X_1=0)$	0.2	0.3	0.5
$\mathbb{P}(X_1=1)$	0.1	0.4	0.5
$p_{X_2}$	0.3	0.7	1

→ In continuous case with integrals

#### Conditional distribution

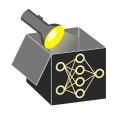

$$\begin{aligned} \rho_{X_1|X_2}(x_1|x_2) &= \mathbb{P}(X_1 = x_1|X_2 = x_2) \\ &= \frac{\rho_{X_1,X_2}(x_1,x_2)}{\rho_{X_2}(x_2)} \end{aligned}$$

	$x_2 = 0$	$x_2 = 1$
$\mathbb{P}(X_1=0 X_2=x_2)$	0.67	0.43
$\mathbb{P}(X_1=1 X_2=x_2)$	0.33	0.57
$\sum$	1	1

**Dependence:** Describes general dependence structure (e.g., non-lin. relationships)

• Definition:  $X_j$ ,  $X_k$  independent  $\Leftrightarrow$  joint distribution is product of marginals:

$$\mathbb{P}(X_j, X_k) = \mathbb{P}(X_j) \cdot \mathbb{P}(X_k)$$

**Dependence:** Describes general dependence structure (e.g., non-lin. relationships)

• Definition:  $X_j$ ,  $X_k$  independent  $\Leftrightarrow$  joint distribution is product of marginals:

$$\mathbb{P}(X_j,X_k)=\mathbb{P}(X_j)\cdot\mathbb{P}(X_k)$$

$$\mathbb{P}(X_j|X_k) = \mathbb{P}(X_j)$$
 and  $\mathbb{P}(X_k|X_j) = \mathbb{P}(X_k)$  (follows from cond. probability)

**Dependence:** Describes general dependence structure (e.g., non-lin. relationships)

• Definition:  $X_j$ ,  $X_k$  independent  $\Leftrightarrow$  joint distribution is product of marginals:

$$\mathbb{P}(X_j,X_k)=\mathbb{P}(X_j)\cdot\mathbb{P}(X_k)$$

• Equivalent definition (knowledge of  $X_k$  says nothing about  $X_j$  and vice versa):

$$\mathbb{P}(X_j|X_k) = \mathbb{P}(X_j)$$
 and  $\mathbb{P}(X_k|X_j) = \mathbb{P}(X_k)$  (follows from cond. probability)

- Measuring complex dependencies is difficult but different measures exist, e.g.,
  - → Spearman correlation (measures monotonic dependencies via ranks)
  - → Information-theoretical measures like mutual information

**Dependence:** Describes general dependence structure (e.g., non-lin. relationships)

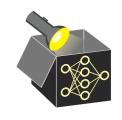

• Definition:  $X_j$ ,  $X_k$  independent  $\Leftrightarrow$  joint distribution is product of marginals:

$$\mathbb{P}(X_j,X_k) = \mathbb{P}(X_j) \cdot \mathbb{P}(X_k)$$

• Equivalent definition (knowledge of  $X_k$  says nothing about  $X_j$  and vice versa):

$$\mathbb{P}(X_j|X_k) = \mathbb{P}(X_j)$$
 and  $\mathbb{P}(X_k|X_j) = \mathbb{P}(X_k)$  (follows from cond. probability)

- Measuring complex dependencies is difficult but different measures exist, e.g.,
  - → Spearman correlation (measures monotonic dependencies via ranks)
  - → Information-theoretical measures like mutual information
  - → Kernel-based measures like Hilbert-Schmidt Independence Criterion (HSIC)
- N.B.:  $X_j$ ,  $X_k$  independent  $\Rightarrow \rho(X_j, X_k) = 0$  but  $\rho(X_j, X_k) = 0 \Rightarrow X_j$ ,  $X_k$  indep. Equivalency holds if distribution is jointly normal

### **MUTUAL INFORMATION**

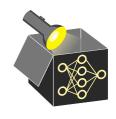

• MI describes expected amount of information shared by two random variables:

$$MI(X_1; X_2) = \mathbb{E}_{p(x_1, x_2)} \left[ log \left( \frac{p(x_1, x_2)}{p(x_1)p(x_2)} \right) \right]$$

$$\rightsquigarrow MI(X_1, X_2) = \mathbb{E}_{p(x_1, x_2)} \left[ log \left( \frac{p(x_1, x_2)}{p(x_1, x_2)} \right) \right] = \mathbb{E}_{p(x_1, x_2)} \left[ log(1) \right] = 0$$
  $\rightsquigarrow MI(X_j, X_k) = 0$  if and only if the features are independent

• Unlike (Pearson) correlation, MI is not limited to continuous random variables

## **MUTUAL INFORMATION: EXAMPLE**

For two discrete RV  $X_1$  and Y:

$$\mathit{MI}(X_1;Y) = \mathbb{E}_{p(x_1,y)}\left[\log\left(\frac{p(x_1,y)}{p(x_1)p(y)}\right)\right] = \sum_{x_1 \in \mathcal{X}_1} \sum_{y \in \mathcal{Y}} p(x_1,y)\log\left(\frac{p(x_1,y)}{p(x_1)p(y)}\right)$$

<b>X</b> <sub>1</sub>	 Υ
yes	 yes
yes	 no
no	 yes
no	 no

	$\mathbb{P}(X_1 = \text{yes})$	$\mathbb{P}(X_1 = no)$	$p_Y$
$\mathbb{P}(Y = \text{yes})$	0.25	0.25	0.5
$\mathbb{P}(Y = no)$	0.25	0.25	0.5
$p_{X_1}$	0.5	0.5	1

### **MUTUAL INFORMATION: EXAMPLE**

For two discrete RV  $X_1$  and Y:

$$MI(X_1; Y) = \mathbb{E}_{p(x_1, y)} \left[ log \left( \frac{p(x_1, y)}{p(x_1)p(y)} \right) \right] = \sum_{x_1 \in \mathcal{X}_1} \sum_{y \in \mathcal{Y}} p(x_1, y) log \left( \frac{p(x_1, y)}{p(x_1)p(y)} \right)$$

<b>X</b> <sub>1</sub>	 Υ
yes	 yes
yes	 no
no	 yes
no	 no

	$\mathbb{P}(X_1 = \text{yes})$	$\mathbb{P}(X_1 = no)$	$p_Y$
$\mathbb{P}(Y = \text{yes})$	0.25	0.25	0.5
$\mathbb{P}(Y = no)$	0.25	0.25	0.5
$p_{X_1}$	0.5	0.5	1

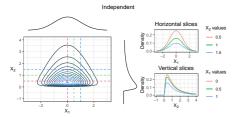

$$MI(X_1; Y) = 0.25 \log \left(\frac{0.25}{0.5 \cdot 0.5}\right) + 0.25 \log \left(\frac{0.25}{0.5 \cdot 0.5}\right)$$

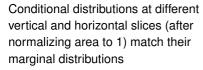

$$= 0.25 \log \left(\frac{0.25}{0.25}\right) \cdot 4$$

$$= 0.25 \log (1) \cdot 4 = 0$$

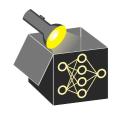

## **DEPENDENCE AND INDEPENDENCE**

### Example:

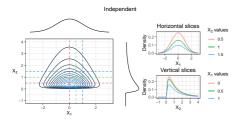

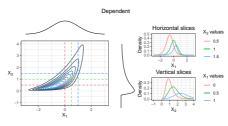

$$\Rightarrow \mathbb{P}(X_1|X_2) = \mathbb{P}(X_1)$$
$$\mathbb{P}(X_2|X_1) = \mathbb{P}(X_2)$$

## **DEPENDENCE AND INDEPENDENCE**

#### Example:

Conditional distributions at different vertical and horizontal slices (after normalizing area to 1) match their marginal distributions

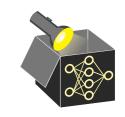

$$\Rightarrow \mathbb{P}(X_1|X_2) = \mathbb{P}(X_1)$$
$$\mathbb{P}(X_2|X_1) = \mathbb{P}(X_2)$$

Conditional distributions do not match their marginal distributions

### **CORRELATION VS. DEPENDENCE**

Illustration of bivariate normal distribution with different correlations  $X_1, X_2 \sim N(0, 1)$ 

$$ho(X_1, X_2) = 0$$
  $ho(X_1, X_2) = 0.8$   $ho(X_1, X_2) = -0.8$  (independent)

### **CORRELATION VS. DEPENDENCE**

Illustration of bivariate normal distribution with different correlations  $X_1$ ,  $X_2 \sim N(0,1)$ 

$$(independent)$$

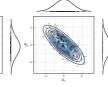

$$\rho(X_1,X_2) =$$

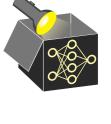

$$\rho(X_1, X_2) = 0$$
 $\rho(X_1, X_2) = 0.8$ 
 $\rho(X_1, X_2) = -0.8$ 

Examples with Pearson's correlation  $\rho \approx 0$  but non-linear dependencies (MI  $\neq 0$ ):

$$\rho(X_1,X_2) = 0 \; , \; \; \text{MI}(X_1,X_2) = 0.52 \qquad \rho(X_1,X_2) = 0.01 \; , \; \; \text{MI}(X_1,X_2) = 0.37 \quad \rho(X_1,X_2) = -0.06 \; , \; \; \text{MI}(X_1,X_2) = 0.61 \; , \; \; \text{MI}(X_1,X_2) = 0.01 \; , \; \;$$
